Cerebrovascular Diseases:

- Primary cause of permanent disability
- Third cause of death
- In 20% of octogenarians (Moore 1995; Benavente 1998)

Economic Impact

The cost of a patient who has suffered a stroke is about 34.000 €

During the first year can ranges from 9.500 € to 32.000 €

Terent Stroke 1994

Symptomatic Patients

RACCOMANDAZIONE 13.1 GRADO A:

L'endoarteriectomia carotidea è indicata nella stenosi **sintomatica** uguale o maggiore del 70% (valutata con il metodo NASCET).

RACCOMANDAZIONE 13.2 GRADO A:

sintomatica

	CEA	Results
NASCET	25 CEA /y <6% event rate	CEA > Medical Tx
ECST	≥12 CEA /y <5% event rate <3% for aSx patients	CEA > Medical Tx

Asymptomatic Patients

Carotid Endarterectomy for Asymptomatic Carotid Stenosis

Asymptomatic Carotid Surgery Trial

P.M. Rothwell, MD, PhD, FRCP; L.B. Goldstein, MD

Effective prevention is inarguably the best option for reducing the individual and societal burden of stroke. For each patient, clinicians balance the benefits of a given preventive therapy against its associated risks and costs. Where possible, these assessments should be based on the results of randomized clinical trials. Carotid endarterectomy (CEA), the most-commonly used surgical procedure to prevent stroke, has been subjected to several randomized trials. These underlie evidence-based guideline and consensus statements providing recommendations for its use.^{1–7} The evidence base for endarterectomy for symptomatic stenosis is considerable,^{8,9} but guidelines on surgery for asymptomatic stenosis have been largely based on the results of the Asymptomatic Carotid Atherosclerosis Study (ACAS)¹⁰ in conjunction with other smaller trials.^{11,12} Guidance differs from endorsement of the operation for selected patients (eg, based on patient age, life expectancy, concomitant illnesses, etc.) with varying degrees of asymptomatic stenosis (gener-

There was also concern that the very low operative risks in ACAS (excluding complications of angiography: 1.5%, 95% CI, 0.6% to 2.4% for stroke and death; and 0.14%, 95% CI, 0% to 0.4%, for death) could not be matched in routine clinical practice. ACAS only accepted surgeons with an excellent safety record, rejecting 40% of initial applicants and subsequently barring from further participation some surgeons who had adverse operative outcomes during the trial.¹⁴ Figure 1 compares the operative risks in ACAS with the results of a meta-analysis of the 46 surgical case series that published operative risks for asymptomatic stenosis during ACAS and the 5 years after publication.¹⁵ Operative mortality

ACAS
Stroke 2004

Alison Halliday, Michael Harrison, Elizabeth Hayter, Xiangling Kong, Averil Mansfield, Joanna Marro, Hongchao Pan, Richard Peto, John Potter, Kozem Rahimi, Angela Rau, Steven Robertson, Jonathan Streifler, Dafydd Thomas, on behalf of the Asymptomatic Carotid Surgery Trial (ACST) Collaborative Group*

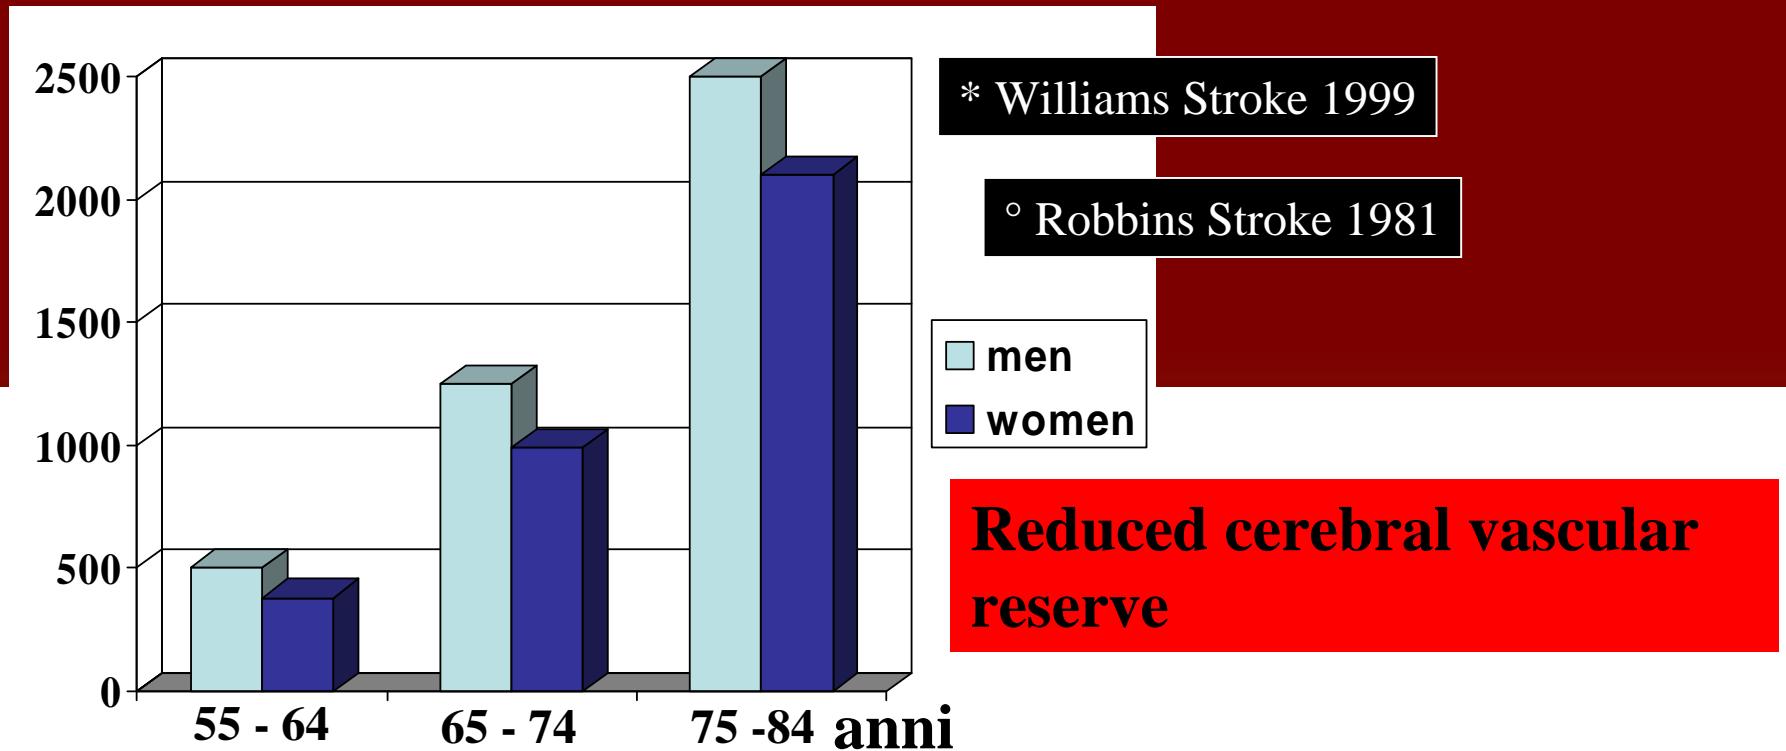

Summary

Lancet 2010; **376:** 1074–84
See Editorial page 1025
See Comment page 1078

Background If carotid artery narrowing remains asymptomatic (ie, has caused no recent stroke or other neurological symptoms), successful carotid endarterectomy (CEA) reduces stroke incidence for some years. We assessed the long-term effects of successful CEA.

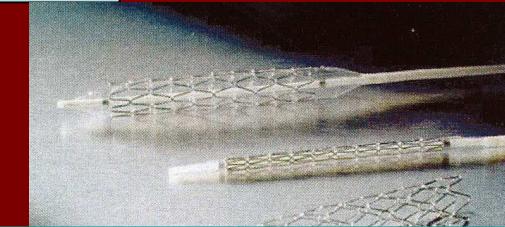

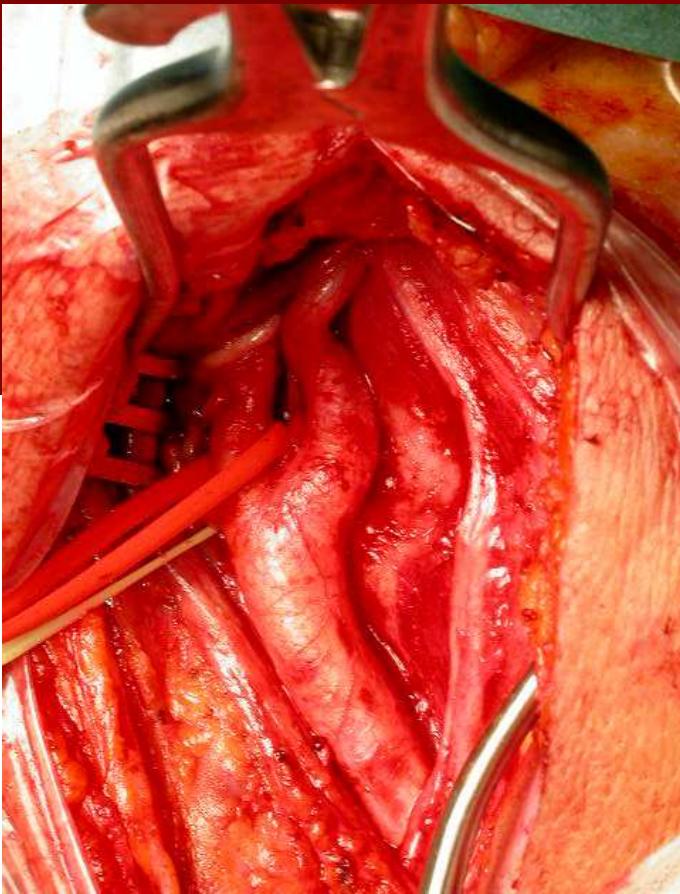

(3.5% in the surgical group versus 6.1% in the no surgery group)

Octogenarian asymptomatic patient: high risk of stroke

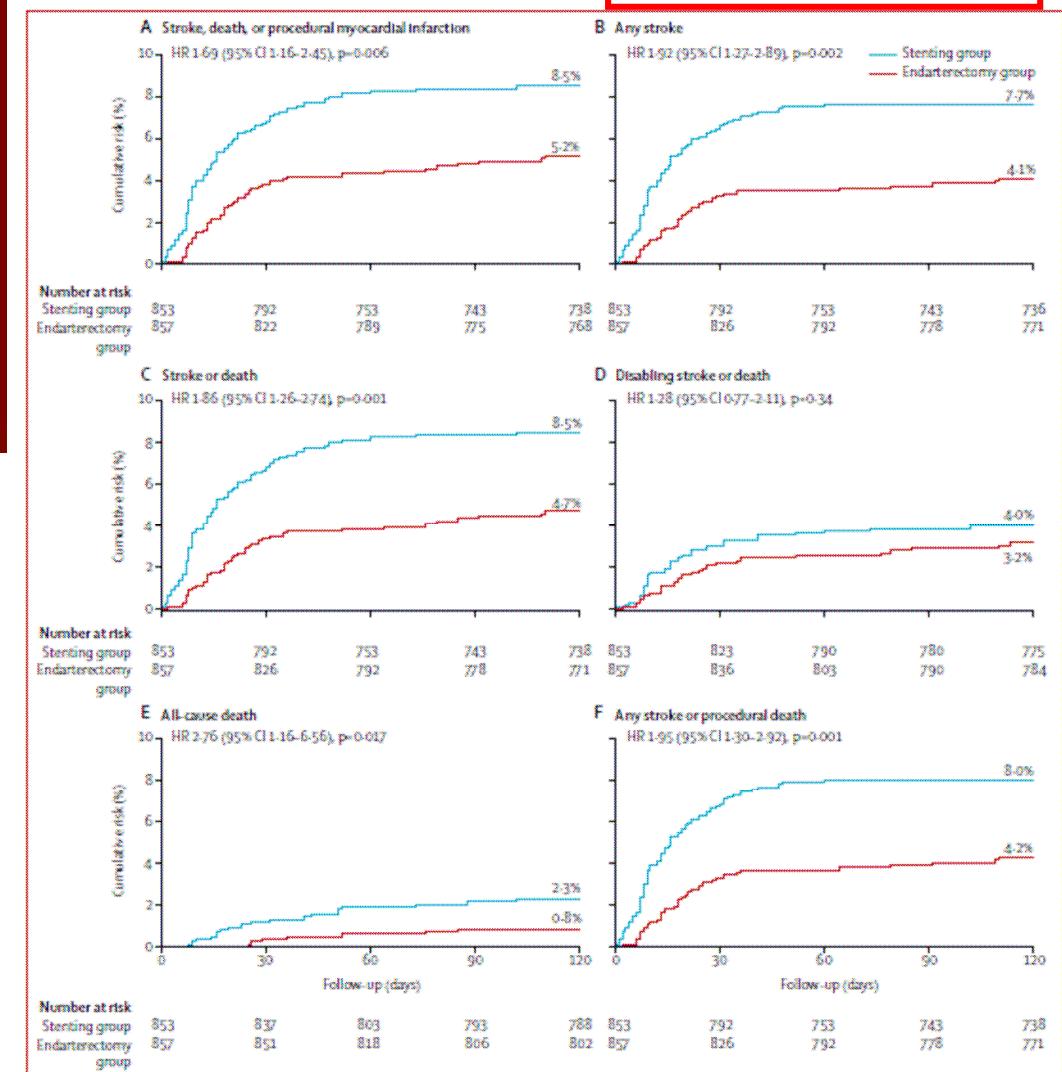

The incidence of stroke increases exponentially with age*
and is the second cause of death after 85 yy.[°]

CEA o CAS?

	Stenting group (n=853)	Endarterectomy group (n=857)	Hazard ratio (95% CI)	Risk difference, % (95% CI)	p value*
Stroke, death or procedural myocardial infarction	72 (8.5%)	44 (5.2%)	1.69 (1.16 to 2.45)	3.3% (0.9 to 5.7)	0.006
Any stroke	65 (7.7%)	35 (4.1%)	1.92 (1.27 to 2.89)	3.5% (1.3 to 5.8)	0.002
Any stroke or death	72 (8.5%)	40 (4.7%)	1.86 (1.26 to 2.74)	3.8% (1.4 to 6.1)	0.001
Any stroke or procedural death	68 (8.0%)	36 (4.2%)	1.95 (1.30 to 2.92)	3.8% (1.5 to 6.0)	0.001

Carotid artery stenting compared with endarterectomy in patients with symptomatic carotid stenosis (International Carotid Stenting Study): an interim analysis of a randomised controlled trial

International Carotid Stenting Study investigators*

Summary

Background Stents are an alternative treatment to carotid endarterectomy for symptomatic carotid stenosis, but

Lancet 2010; 375: 985-97

Figure 3: Kaplan-Meier estimates of cumulative incidence of various outcome measures.
 Data were analysed by intention to treat. The numbers above the end of the lines are the incidence estimates at 120 days after randomisation. HR=hazard ratio.

Table 3. Primary End Point and Its Individual Components among the 1181 Asymptomatic and the 1321 Symptomatic Patients, According to Treatment Group.*

2. Bedside prediction tool for death or stroke at 30 days after carotid artery stenting. The total point score gives the predicted probability for death or stroke at 30 days according to the following equation:

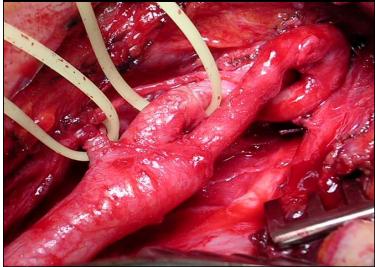

Death occurred in 123 patients (1.2%) and stroke in 301 (3.0%) within 30 days of CAS. A total of 366 patients had either stroke or death within 30 days. Two hundred forty-five strokes were ipsilateral (79.5% of strokes) and 276 were ischemic (91.7%). Lacunar strokes occurred in 33 subjects (11.9% of ischemic strokes). There were 25 hemorrhagic strokes.

Table 3. Final Logistic Regression Model for Death or Stroke at 30 D After Carotid Artery Stenting

Variable	Adjusted Beta	Adjusted OR	95% CI for Adjusted OR	P Value
Age per 10 y	0.417	1.520	1.32-1.81	<0.001

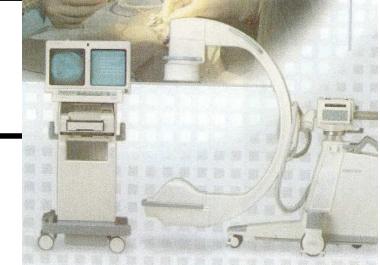

OUR EXPERIENCE

1/2003-1/2013

RACCOMANDAZIONE 13.6 GRADO A:

L'intervento di endoarteriectomia in caso di stenosi carotidea asintomatica uguale o maggiore al 60% (valutata con il metodo NASCET) è indicato solo se il rischio operatorio (entro 1 mese dall'intervento) di complicanze gravi è particolarmente basso (almeno inferiore al 3%). Il beneficio, in termini di riduzione assoluta del rischio di ictus, è modesto (1% per anno) e aumenta con gli anni successivi di *follow-up*.
